Bombay: AQUULY. SEPTEMBER. Day of Quantity of the month. Lain in In. Tenths. 19 - 0 22 22 - 0 2 20 - 0 2 23 - 0 3 21 - 0 1 24 - 3 22 - 0 4 25 - 0 2 25 - 0 4 20 - 0 2 26 - 0 7 27-30 - 0 0 27 - 0 5 Octobre. 28 - 0 2 2-7 - 2 1 30 - 0 1 9 - 0 31 - 0 0 2 15 - 0 3 SEPTEMBER. 16, 17 - 1 - 1 1 1 - 0 2 13 The air fine and 3 - 0 3 clear, without a cloud, the 9 - 0 1 had and fee-breczes re- 9 - 4 pulter. 10 - 0 5 While quantity of rain in 11 - 0 9 11 - 0 0 9 12 - 0 2 May - 1 13 - 0 5 June - 44 7 16 - 0 4 July - 19 9 17 - 0 0 4 August - 19 9 18 - 0 5 September - 11 2 19 - 9 - 6 October - 4 5 20 - 3 2 21 - 0 4 Total 10 3 In this journal one author makes no mention of the elephants above mentioned from Mr Grefe as the fore- runner of the rainy fashion, though he mentions at form under that reason on the pH of October. It was an exceller hard gole with violent thunders, lightning, and rainy of which left there fill over inches in our more than our home. Neither is the quantity of thunder and lightning at all comparable to what people unexamined with her element might be apg to see peel. The only thunder-forms mentioned in the journal were on May 1st. June 3d, 5th, 12th, 14th; September 20th, October, an elephant s and font thunder on the 12th of this time month.

The vegetable production of Bombay are very in- schoolfor significant. Mr Ives fays, that is it felt is fo between Bombay as not to produce more thing worth mentioning? but afterwards informs us, that its natural product is the uncount tree, from which they extract a li- quor called today. This is full and mild when drink immediately, but if the hands long, it golden through, and becomes very interesting wherever probably made the term _field_-loaded. For each tree a tax of 20s a year is paid to the company, which is appropriated- weds maintaining the genetics and alware?

Mr Grofe gives an account fomewhat different The parts, or non-out grows, make the muff con- fidential part of the health property, being started wherever the futuation and foil is favorable to them. Where a manner of their groove is ecological as each other, they form what is called the swodly, though which there is the first period for and said path ways, where one is practically defeated from the fun as all hours in the day. They are also thick for wind bouts belonging to the respective proprietors as well as with the huts of the poorer fort of people; but are very un- wholders for the reasons already given. As to the

Vol. III. Part I.

conomunt tree itself, not all the minute. decriptions I Bombay.

As to the rice fields, they differ in value, accom- ding to the fietsed and quantity of rice they probate. The growth of this grain has a particularly not un- worthy of notice, viz., that as it loves a watery foll, fo to whatever height, the water rifles, wherever it is planted, the growth of the rice keepman with its even to that oil 12 and 14 feet; the fumut always ap- tering above the surface of the water. It is also re- marked, that the ageing of raw rise affects the eyes. The fish is certain, though the physical region of it is unknown.

Here and there are interperfed fome few _berab_ _trees_, or rather will palm trees (the wood trail being derived from limbs, which in the Portuguese, figuifies wild). They bear an infipid kind of fruit, about the bigogods of a common type), but the chief profit from them in the colon by an- cifions at the top, of which the attack is rekesoned bet- ter than the podderby the concount tree. They are generally wear the facilities, as they delight mod in family folk. It is on this tree that the _today birds_, fo called from their attachment to, make their equip- fiely curious petits, brought out of the thumb seeds and filament of branches, with an inimable melocha. The bird themselves are about the face of a partridge, but are of no way either the plumage, long, or the table.

This island is a drug influence of the benefits of a good, governments, and a numerous population, by not a spot of it remaining unaffnered. So that the life from producing sufficient for the compliment of its inhabitants, and notwithstanding its many difad- mages of titanium and bulk, it yields incomparably more than the adjacent illand of Salette. 6.

Among the curities of Bombay Mr Ives mentions Curidioles a large temple or both tortured kept as the governed in his boat, the age of which was upwards of 20 years. Bland Frugs, which abound every where through the Fall Indies, are very large as Bombay. One author fav one that preferred 22 inches from the extremities of the front and final feet when extended it and its popo- far that its weight would not have been life into four or five pounds. On the fe-shore round the illand are a great variety of beautiful shells, particularly the fort called second-type, rounded corps, held in great re- ferment among the lades fome time ago. Several pounds Steiling are fail to have taken given by a relatively for one of the field when the Communisme Lellice col- lection of wells was fold by auction.

Mr Mrs Encuentrates the following kinds of flakes different found on this island and other parts of the British em-kind of pire in the Falk Indies. 1. The colors of cafylla, grow, depres its from four to eight or nine feet long. They fallould here. by their bite in 15 minutes. 2. The color marble is a small bluish fnake, of the fire of a man's little finger, and about a foot long, frequently ten about old walls. A species of their found as Bombay kill much longer than Blad. that fee them, until they are taught by a make or tutors; I have (for the goodwill I later to flush unfortunate person) contrived the following table: _A New Music-Teale for fach as ate Belino._ A A C C B B A A B A A B Wine Teile A When Bele B When Bele A A When Bele A When Bele A When Bele EXSEARATION.

" Let AB be a Smooth board, 3 or 4 feet long, 1 inch thick, and 9 inches wide, with 7 figures ledges glued thoron each being half an inch alunder, half inch wide, and half an inch high, which tilting edges reprefront our 5 lines of moiic, and their faces; and the top outward lines, being made a little more, my few a large lines, as creation. The cypliers reprefeent to many holes lined into every line and paper, half an inch slunder > wherein pegs if different shapes are to feet, to reprend the federal forts of notes and characters of the tunes, which pegs the blind perform may know by feeling, as well as he does his keys of the organ or harphdons. To this, by keeping his fingers on the 2 lines, he feels the ferrugpas as they come on, and see for, to reprend the femoral loss of notes, on both line and faces; whilst his right hand flicks the respective key, kc. for left knowing the names of all his keys, hit lines, figures, and the mark of every peg. Let each peg be about half an inch high, when it is very fair. (N. B). The blind perken mault fril be taught the names of the above and places in both the treble and bals cliffs; and that he multi fed his treble and his system hand, and has had with the left hand; each being courtesy, as you may fee by the letters of the above table, A and B; and the learnt past spignants.

" Of regy, he mall have a great number of every fold, to fit his tune with, which he may mark as follows : For a Smith sees, 4 top-notches.

Niinim, 2 top-notches. _Grachet, 1 top-notch._ _Seniors, one corner cut off._ _Seniorswere, 2 corners cut off._ _Denifeniquaver, all 4 corners cut off._ **Replo, a notch in the course.** _A. That, a notch on the field._ _Sharp, 2 notches on the field._ _Bas, a first thin top._ _Repeat, a sharp-pointed top, &c. e.c. &c._ this, by _feling_, they may underland notes, and Blind. learn any tune that shall be fet them, in their matters absence.

by one as they are called for by the perfon that fets his tone. Thus far our authors. We have already complained, that Timurice Mullinal Nazism in imperfect, and perhaps every take on instrument of the inner kind may be liable to the fans ceulny, as not being comprelien- the of all the characters in the written language of mu- fic, that the blind reader may find any deficiency in acquiring any lefion; yet as the cushion of Mr Cheefe appears to have more prone than any other infanter for the fans purpose that has hitherto occurred to our observation, though attended with many formi- able objections, we here refers. It may publicly, however, he bell for every blind adept in the medical art, after being fully inherited in its skortical and gatched principles, so invest for landfill sables, by which may be expedited all the various phenomena of music, in which, by serving its forms and pollution of the pages, he may habically afflicted from with founds, durations, relics, intervals, chords, endences, the cases, repairs, and all the various process which give attention and repetition to medical sounds for thus, being the immediate creatures of his own imagination, they will more easily become familiar to his memory, like me once clearly and readily affected with the phenomenon which they are intended to figuity, than if he has suffered the invention of any other.

_At Clachy definition of for instance, for teaching Cheete's music to people deprived of fight, and to enable them to machine, precise their compositions, in the kind of compelling, with PLAXVII, and the influence of a cryptic Thema of the am Ago v chine which represents the book, or paper, is a small culmite fluffus, on a little frames along which, is fewed a number of pick-thrid fringe, at equal of flances from each other; their reprend the lines in a much book of the five which compete the films, are made of larger trees; and those which represent the leger or occasional lines, drawn through the heads of the ones, where the multic encoded the gemapel of the ethabilified flaws, are made of final tones, and are on this machine of the fame length as the others.

? If the preference only wishes to write harphochd music, the cushion may be what length he pleales, and about five or fix inches wide: the fringe matt be fewed in the following order: beginning with the first

In this journal our author makes no mention of the elephanta above mentioned from Mr Groſe as the forerunner of the rainy ſeaſon, though he mentions a ſtorm under that name on the 9th of October. It was an exceſſive hard gale, with violent thunder, lightning, and rain; of which laſt there fell two inches in no more than four hours. Neither is the quantity of thunder and lightning at all comparable to what people unacquainted with hot climates might be apt to expect. The only thunder-ſtorms mentioned in the journal were on May 31ſt, June 3d, 5th, 12th, 14th; September 7th, October 9th, an elephanta; and ſome thunder on the 15th of the ſame month.

5. getable oductions Bombay. The vegetable productions of Bombay are very inſignificant. Mr Ives ſays, that its “ſoil is ſo barren as not to produce any one thing worth mentioning;” but afterwards informs us, that its “natural produce is the cocoa-nut tree, from which they extract a liquor called *toddy*. This is ſoft and mild when drunk immediately: but if it ſtands long, it gathers ſtrength, and becomes very intoxicating; whence probably aroſe the term *toddy-headed*. For each tree a tax of 20 s. a-year is paid to the company, which is appropriated towards maintaining the garriſon and ſhips of war.”

Mr Groſe gives an account ſomewhat different.—“The *oarts*, or cocoa-nut groves, make the moſt conſiderable part of the landed property, being planted wherever the ſituation and ſoil is favourable to them. When a number of theſe groves lie contiguous to each other, they form what is called the *woods*; through which there is a due ſpace left for roads and path-ways, where one is pleaſantly defended from the ſun at all hours in the day. They are alſo thick ſet with houſes belonging to the reſpective proprietors as well as with the huts of the poorer ſort of people; but are very unwholeſome for the reaſons already given. As to the cocoa-nut tree itſelf, not all the minute deſcriptions I have met with in many authors ſeem to me to come up to the reality of its wonderful properties and uſe. The cultivation of it is extremely eaſy, by means of channels conveying water to the roots, and by the manure already mentioned laid round them. An owner of 200 cocoa-nut trees is ſuppoſed to have a competency to live on.

Bombay.

“As to the rice fields, they differ in value, according to the fineneſs and quantity of rice they produce. The growth of this grain has a particularity not unworthy of notice, viz. that as it loves a watery ſoil, ſo to whatever height the water riſes, wherever it is planted, the growth of the rice keeps meaſure with it, even to that of 12 and 14 feet; the ſummit always appearing above the ſurface of the water. It is alſo remarked, that the eating of new rice affects the eyes. The fact is certain, though the phyſical reaſon of it is unknown.

“Here and there are interſperſed ſome few *brab trees*, or rather wild palm trees (the word *brab* being derived from *brabo*, which in the Portugueſe ſignifies *wild*.) They bear an inſipid kind of fruit, about the bigneſs of a common pear; but the chief profit from them is the toddy, or liquor drawn from them by inciſions at the top, of which the arrack is reckoned better than that produced by the cocoa-nut trees. They are generally near the ſea-ſide, as they delight moſt in a ſandy ſoil. It is on this tree that the *toddy birds*, ſo called from their attachment to it, make their exquiſitely curious neſts, wrought out of the thinneſt reeds and filaments of branches, with an inimitable mechaniſm. The birds themſelves are about the ſize of a partridge, but are of no value either for plumage, ſong, or the table.

“This iſland is a ſtrong inſtance of the benefits of a good government, and a numerous population, by not a ſpot of it remaining uncultivated: ſo that tho' it is far from producing ſufficient for the conſumption of its inhabitants, and notwithſtanding its many diſadvantages of ſituation and ſoil, it yields incomparably more than the adjacent iſland of Salſette.”

6. Curioſities in this iſland. Among the curioſities of Bombay Mr Ives mentions a large *terapin* or land tortoiſe kept at the governor's houſe, the age of which was upwards of 200 years. Frogs, which abound every where through the Eaſt Indies, are very large at Bombay. Our author ſaw one that meaſured 22 inches from the extremities of the fore and hind feet when extended; and he ſuppoſes that its weight would not have been leſs than four or five pounds. On the ſea-ſhore round the iſland are a great variety of beautiful ſhells, particularly the ſort called *wentle-traps* or *wendle-traps*, held in great eſteem among the ladies ſome time ago. Several pounds Sterling are ſaid to have been given by a *virtuoſo* for one of theſe ſhells when the Commodore Leſlie's collection of ſhells was ſold by auction.

7. Different kinds of ſerpents found here. Mr Ives enumerates the following kinds of ſnakes found on this iſland and other parts of the Britiſh empire in the Eaſt Indies. 1. The *cobra de capella*, growing from four to eight or nine feet long. They kill by their bite in 15 minutes. 2. The *cobra manila* is a ſmall bluiſh ſnake, of the ſize of a man's little finger, and about a foot long, frequently ſeen about old walls. A ſpecies of theſe found at Bombay kill much ſooner

Blind.

that ſee them, until they are taught by a maſter or tutor; I have (for the good-will I bear to ſuch unfortunate perſons) contrived the following table; that, by *feeling*, they may underſtand notes, and learn any tune that ſhall be ſet them, in their maſter's abſence.

A New Music-Table for ſuch as are Blind.

A G F E D C B A G F E D C
C B A G F E D C B A G F E
When Treble
When Baſs
A
B

Explanation.

"Let A—B be a ſmooth board, 3 or 4 feet long, 1 inch thick, and 9 inches wide, with 5 ſquare ledges glued thereon, each being half an inch aſunder, half an inch wide, and half an inch high; which riſing ledges repreſent our 5 lines of muſic, and their ſpaces: and the two outward lines, being made a little lower, may ſerve as leger lines, on occaſion. The cyphers repreſent ſo many holes bored into every line and ſpace, half an inch aſunder; wherein *pegs* of different ſhapes are to be ſet, to repreſent the ſeveral ſorts of notes and characters of the tune: which pegs the blind perſon may know by feeling, as well as he does his keys of the organ or harpſichord: ſo that, by keeping his fingers on the 5 lines, he feels the ſeveral pegs as they come on, and are ſet to repreſent the ſeveral ſorts of notes, on both line and ſpace; whilſt his right hand ſtrikes the reſpective key, &c. he firſt knowing the names of all his keys, his lines, ſpaces, and the mark of every peg. Let each peg be about half an inch high, when ſet in very faſt. [N. B. The blind perſon muſt firſt be taught the names of the above lines and ſpaces in both the treble and baſs cliffs; and that he muſt feel his treble with his right hand, and his baſs with the left hand; each being contrary, as you may ſee by the letters of the above table, A and B; and muſt learn each part ſeparate.]

"Of pegs, he muſt have a great number of every ſort, to ſet his tune with, which he may mark as follows:

For a *Semibreve*, 4 top-notches.
  Minim, 2 top-notches.
  Crotchet, 1 top-notch.
  Quaver, one corner cut off.
  Semiquaver, 2 corners cut off.
  Demiſemiquaver, all 4 corners cut off.
 Reſts, a notch in the corner.
 A *Flat*, 1 notch on the ſide.
  Sharp, 2 notches on the ſide.
  Point, 3 notches on the ſide.
  Bar, a flat thin top.
  Repeat, a ſharp-pointed top, &c. &c. &c.

"But it is beſt for every performer to make and mark his own pegs; and deliver them one by one as they are called for by the perſon that ſets his *tune*."

Thus far our author. We have already complained, that Tanſure's Muſical Notation is imperfect; and perhaps every table or inſtrument of the ſame kind may be liable to the ſame cenſure, as not being comprehenſive of all the characters in the written language of muſic, ſo that the blind reader may find no deficiency in acquiring any leſſon: yet as the cuſhion of Mr Cheeſe appears to have more powers than any other inſtrument for the ſame purpoſe that has hitherto occurred to our obſervation, though attended with many formidable objections, we here inſert it. It may poſſibly, however, be beſt for every blind adept in the muſical art, after being ſufficiently inſtructed in its theoretical and practical principles, to invent for himſelf a table, by which may be expreſſed all the various phenomena of muſic, in which, by varying the forms and poſitions of his peggs, he may habitually aſſociate them with ſounds, durations, reſts, intervals, chords, cadences, da capos, repeats, and all the various graces which give animation and expreſſion to muſical ſounds: for thus, being the immediate creatures of his own imagination, they will more eaſily become familiar to his memory, and be more ſtrongly and readily aſſociated with the phenomena which they are intended to ſignify, than if he had aſſumed the inventions of any other.

56
Cheeſe's machine,
Pl XCVIII.
fig. 9.

Mr Cheeſe's deſcription of his machine for teaching muſic to people deprived of ſight, and to enable them to preſerve their compoſitions, in the act of compoſing, without the aſſiſtance of a copyiſt.—"That part of the machine which repreſents the book, or paper, is a ſmall cuſhion ſtuffed, on a little frame; along which, is ſewed a number of pack-thread ſtrings at equal diſtances from each other; theſe repreſent the lines in a muſic book: the five which compoſe the ſtave, are made of large twine; and thoſe which repreſent the leger or occaſional lines, drawn through the heads of the notes, where the muſic exceeds the compaſs of the eſtabliſhed ſtave, are made of ſmall twine, and are on this machine of the ſame length as the others.

"If the practitioner only wiſhes to write harpſichord muſic, the cuſhion may be what length he pleaſes, and about five or ſix inches wide: the ſtrings muſt be ſewed in the following order; beginning with the firſt
