NRls. or White River, which, according to the accounts given by the Galla, our author fuppoles to take its rise in about 9 north latitude.

The rains therefore precede the fun only about 6ř; but they continue and incredible after he has puffed it. In April all the rivers in the foubern parts of Ablyr finis begin to softw), and greatly augment the Nile which is now alfo farther augmented by the vaft quantity of water poured into the Nile Tazan. On the first day of May, the fun paths the village of Cerrij, which is the limit of the tropical rains, and it is very remarkable, that, though the fun still continues to cooperate with enhanced region. All his influence cannot bring the clouds further northward than this village; the restor of whole Mr Brune, with great restforu popsots to be the want of mountains to the northward. In confirmation of this opinion, he offerences, that the tropical rains flop at the latitude of 14" infuse of 10" in the welfare part of the continent. All this time, however, they continue violent in Abyfllina i and in the beginning of June the rivers are all full, and continue to while the fun remains Rationalny in the top pic of Cancer.

This sacrifice rain, which would freeze off the whole foil of Egypt into the few were it to continue with out intermition, begins to share as the fun turns fouthward, and on his arrival at the zenith of each place, on his judged towards that quarter, they cease entire ly: the reason of which is no left difficult to be dif- covered than that of their coming on when he arrives at the same in a jingling southward. Be the rea fan what it will, however, the fact is certain; and not only lo, but the time of the main catalog is each to a finglebay i fishomuch, that so the yach of September her the Nile is generally found to be at its highest at Cairo, and begins to diminish every day after. Im-mediately after the fun has pulled the line, he began the rainy regions to the forthand; the next conflictly coming on with violence as he approaches the sex ninth of each place; but the innovation is now pro- moted in different manner, according to the difference of circumcities in the frutation of the places. From short 83. Lat, a chain of high mountaine runs all the way along the middle of the constant towards the Cape of Good Hogs, and interfects the footbart part of the prinishia nearly in the frame means that the Nile does the northern. A froug wind from the fourth, stopping the groprefs of the condensed vapors, there them against the cold furnists of this edge of mountains, and forms many rivers, which escape on the direction either of salt or well as the level preints it felt. If this is towards the wells they fall down the files of the mountains into the Atlantic and if on the call onto the Indian ocean. -4 The clouds (fays Mr Bruce) hereby the violent action of the fun, we conducted, then broken, and fill as rain on the top of the high ridge, and feel every river; a while a wind from the one run the cell shows like a monsoon each of tiefde fernas, for a electron contrary to their current, during the whole time of the inundation; and this canules toasts alecen into the welfare parts of so Sofials, and the internet counter to the mountains, where lies the gold. The time effect, from the farm caufe, is produced on the western file towards the At- lanice; the high ridge of mountains being placed be-

tween the different countries west and caft, is at once the fourest of their riches, and of those rivers which consider to the treafures, which would be otherwise inaccessible, in the eastern parts of the Kingdoms of Bo-

nin, Congo, and Angola.

There were three remarkable appearances attacking the inundation of the Nile. Every morning in Abyffinia is clear, and the fun thines. About nine, a final cloud, not about four feet to break appears in the early whiting violently around as it upon an axis, but, arrived near the zenith, it frit abates its motions, then find us its form, and extends itself greatly, and forms to call up oppsons from all the specific quarters. These clouds having attained nearly the fame height, ruth again east and other with greet violences, and put me all in mind of Elilin interesting rain on month Carmel. The air impelled before the heaviest malo, or twifl moved, makes an importified of its form on the collection of cloud opposite, and the moment it has taken poffelion of the space made to receive it, the mold violett thunder profile to be conceived initially follows, with rain, a after some hours later by again clearly, with a wind as north; and it is always lifis-greedy old when the thermometer is below 63ř.

4 The third is that remarkable flop in the extent of the rain northward, when the fun, that has concluded the vapour from the lines, and should form now more than ever to be in poffelion of them, is here over-ruiled suddenly; till, on its return to Corrir, again it returns the abloid command over the rain, and reconciledts it to the Line, to ten filn de- lages to the forthand.?

We regled to the Nile life!I, it has been fatal that the quantity of earth brought down by it from Abyfkina is to great, that the whole land of Egypt is produced from it. This question, however, is disculted under the article [2/vary, where it is flown than this cannot potibily be the cake.–Among other authorities that quoted was that of Mr Volory, who frequentally agree against the opinion of Mr Sivory and others, who have maintained that Egypt is the gift of the Nile. nevertheless they, however, we had him atturting that the fall of Egypt has undoubtedly been augmented by the Nile in which side it is not unreadable if dropped that it has been produced by it altogether. -4 The reader (fays by it will conclude, doubtiels, from what I have field, that writers have flatters themselves are much in fuppeling they could fit the precise limits of the enlargement and ripe of the Delta. But, thought I would reject all library circunflances, I am far from decaying the fast to be well founded, it is too plain from realism, and in examination of the country. The rifle of the ground appears not demonstrated by an odibration on which little fresh has been laid. In going near Korkies to Cairo, when the waters are low, as an the mouth of March, we may remark, as we go up the river, that the shore rifles gradually above the water; to that if it overflowed

Nile. or White River, which, according to the accounts given by the Galla, our author ſuppoſes to take its riſe in about 5° north latitude.

The rains therefore precede the ſun only about 5°; but they continue and increaſe after he has paſſed it. In April all the rivers in the ſouthern parts of Abyſſinia begin to ſwell, and greatly augmeut the Nile, which is now alſo farther augmented by the vaſt quantity of water poured into the lake Tzana. On the firſt days of May, the ſun paſſes the village of Gerri, which is the limit of the tropical rains; and it is very remarkable, that, though the ſun ſtill continues to operate with unabated vigour, all his influence cannot bring the clouds farther northward than this village; the reaſon of which Mr Bruce, with great reaſon, ſuppoſes to be the want of mountains to the northward. In confirmation of this opinion, he obſerves, that the tropical rains ſtop at the latitude of 14° inſtead of 16° in the weſtern part of the continent. All this time, however, they continue violent in Abyſſinia; and in the beginning of June the rivers are all full, and continue ſo while the ſun remains ſtationary in the tropic of Cancer.

This exceſſive rain, which would ſweep off the whole ſoil of Egypt into the ſea were it to continue without intermiſſion, begins to abate as the ſun turns ſouthward; and on his arrival at the zenith of each place, on his paſſage towards that quarter, they ceaſe entirely: the reaſon of which is no leſs difficult to be diſcovered than that of their coming on when he arrives at the zenith in his paſſage northward. Be the reaſon what it will, however, the fact is certain; and not only ſo, but the time of the rains ceaſing is exact to a ſingle day; inſomuch, that on the 25th of September the Nile is generally found to be at its higheſt at Cairo, and begins to diminiſh every day after. Immediately after the ſun has paſſed the line, he begins the rainy reaſon to the ſouthward; the rains conſtantly coming on with violence as he approaches the zenith of each place; but the inundation is now promoted in a different manner, according to the difference of circumſtances in the ſituation of the places. From about 6° S. Lat. a chain of high mountains runs all the way along the middle of the continent towards the Cape of Good Hope, and interſects the ſouthern part of the peninſula nearly in the ſame manner that the Nile does the northern. A ſtrong wind from the ſouth, ſtopping the progreſs of the condenſed vapours, daſhes them againſt the cold ſummits of this ridge of mountains, and forms many rivers, which eſcape in the direction either of eaſt or weſt as the level preſents itſelf. If this is towards the weſt, they fall down the ſides of the mountains into the Atlantic, and if on the eaſt into the Indian ocean. "The clouds (ſays Mr Bruce), drawn by the violent action of the ſun, are condenſed, then broken and fall as rain on the top of this high ridge, and ſwell every river; while a wind from the ocean on the eaſt blows like a monſoon up each of theſe ſtreams, in a direction contrary to their current, during the whole time of the inundation; and this enables boats to aſcend into the weſtern parts of Sofala, and the interior country to the mountains, where lies the gold. The ſame effect, from the ſame cauſe, is produced on the weſtern ſide towards the Atlantic; the high ridge of mountains being placed between the different countries weſt and eaſt, is at once the ſource of their riches, and of thoſe rivers which conduct to the treaſures, which would be otherwiſe inacceſſible, in the eaſtern parts of the kingdoms of Benin, Congo, and Angola. Nile.

"There are three remarkable appearances attending the inundation of the Nile. Every morning in Abyſſinia is clear, and the ſun ſhines. About nine, a ſmall cloud, not above four feet broad, appears in the eaſt, whirling violently round as if upon an axis; but, arrived near the zenith, it firſt abates its motion, then loſes its form, and extends itſelf greatly, and ſeems to call up vapours from all the oppoſite quarters. Theſe clouds having attained nearly the ſame height, ruſh againſt each other with great violence, and put me always in mind of Eliſha foretelling rain on mount Carmel. The air impelled before the heavieſt maſs, or ſwifteſt mover, makes an impreſſion of its form on the collection of clouds oppoſite; and the moment it has taken poſſeſſion of the ſpace made to receive it, the moſt violent thunder poſſible to be conceived inſtantly follows, with rain: after ſome hours the ſky again clears, with a wind at north; and it is always diſagreeably cold when the thermometer is below 63°.

"The ſecond thing remarkable is the variation of the thermometer. When the ſun is in the ſouthern tropic, 36° diſtant from the zenith of Gondar, it is ſeldom lower than 72°; but it falls to 60°, and 63°, when the ſun is immediately vertical; ſo happily does the approach of rain compenſate the heat of a too ſcorching ſun.

"The third is that remarkable ſtop in the extent of the rain northward, when the ſun, that has conducted the vapours from the line, and ſhould ſeem now more than ever to be in poſſeſſion of them, is here over-ruled ſuddenly; till, on its return to Gerri, again it reſumes the abſolute command over the rain, and reconducts it to the Line, to furniſh diſtant deluges to the ſouthward."

With regard to the Nile itſelf, it has been ſaid that the quantity of earth brought down by it from Abyſſinia is ſo great, that the whole land of Egypt is produced from it. This queſtion, however, is diſcuſſed under the article EGYPT, where it is ſhown that this cannot poſſibly be the caſe.—Among other authorities there quoted was that of Mr Volney, who ſtrenuouſly argues againſt the opinion of Mr Savary and others, who have maintained that Egypt is the gift of the Nile. Notwithſtanding this, however, we find him aſſerting that the ſoil of Egypt has undoubtedly been augmented by the Nile: in which caſe it is not unreaſonable to ſuppoſe that it has been produced by it altogether.—"The reader (ſays he) will conclude, doubtleſs, from what I have ſaid, that writers have flattered themſelves too much in ſuppoſing they could fix the preciſe limits of the enlargement and riſe of the Delta. But, though I would reject all illuſory circumſtances, I am far from denying the fact to be well founded; it is too plain from reaſon, and an examination of the country. The riſe of the ground appears to me demonſtrated by an obſervation on which little ſtreſs has been laid. In going from Roſetta to Cairo, when the waters are low, as in the month of March, we may remark, as we go up the river, that the ſhore riſes gradually above the water; ſo that if it overflowed
